# Volterra integral equations (VIEs)

A linear VIE of the **second kind** on  $t \in [0, T]$  is a functional equation of the form:

$$(V2): \quad u(t) = g(t) + \int_0^t K(t, s)u(s) ds,$$

$$(V2)_\alpha: \quad u(t) = g(t) + \int_0^t (t-s)^{-\alpha} K(t, s)u(s) ds, \quad 0 < \alpha < 1.$$

Here,  $g(t)$  and  $K(t, s)$  are given functions, and  $u(t)$  is an **unknown function**. The function  $K(t, s)$  is called the **kernel** of the VIE.

A linear VIE of the **first kind** on  $t \in [0, T]$  is given by

$$(V1): \quad \int_0^t K(t, s)u(s) ds = g(t),$$

$$(V1)_\alpha: \quad \int_0^t (t-s)^{-\alpha} K(t, s)u(s) ds = g(t), \quad 0 < \alpha < 1.$$

Here, the unknown function occurs only under the integral sign.

# Volterra integral equations (VIEs)

A linear VIE of the **second kind** on  $t \in [0, T]$  is a functional equation of the form:

$$(V2): \quad u(t) = g(t) + \int_0^t K(t, s)u(s) ds,$$

$$(V2)_\alpha: \quad u(t) = g(t) + \int_0^t (t-s)^{-\alpha} K(t, s)u(s) ds, \quad 0 < \alpha < 1.$$

Here,  $g(t)$  and  $K(t, s)$  are given functions, and  $u(t)$  is an **unknown function**. The function  $K(t, s)$  is called the **kernel** of the VIE.

A linear VIE of the **first kind** on  $t \in [0, T]$  is given by

$$(V1): \quad \int_0^t K(t, s)u(s) ds = g(t),$$

$$(V1)_\alpha: \quad \int_0^t (t-s)^{-\alpha} K(t, s)u(s) ds = g(t), \quad 0 < \alpha < 1.$$

Here, the unknown function occurs only under the integral sign.

# Applications

- Population dynamics, spread of epidemics
- Identification of memory kernel in viscoelasticity and heat conduction
- Retarded potential equations
- ...

**Example:** For the time evolution of the temperature  $u$  at the surface of a conducting solid where there is a high thermal loss:

$$u(t) = \pi^{-1/2} \int_0^t [f(s) - \gamma u^n(s)] ds, \quad t \geq 0.$$

Here,  $\gamma$  – the ratio of the radiative properties to the conductive properties of the solid material     $n = 4$ –Stefan's radiation law     $n = 1$ –Newton's law of cooling

# Fractional differential equations (FDEs) and VIEs

Consider the following Caputo FDE

$$D_*^\alpha u(t) = f(t, u(t)), 0 < \alpha < 1$$

with initial value  $u(0) = u_0$ , where

$$D_*^\alpha u(t) = \frac{1}{\Gamma(1-\alpha)} \int_0^t (t-s)^{-\alpha} u'(s) ds.$$

The above fractional initial value problem can be transformed into the following VIE

$$u(t) = u_0 + \frac{1}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} u(s) ds.$$

# The regularity of VIEs

## The regularity of (V2)

Recall

$$(V2) : u(t) = g(t) + \int_0^t K(t,s)u(s) ds.$$

Theorem (Existence and uniqueness, Brunner, Monograph, 2004)

Let  $K \in C(D)$  and  $R$  denote the resolvent kernel associated with  $K$ . Then for any  $g \in C(I)$ , (V2) has a **unique** solution  $u \in C(I)$ , and this solution is given by

$$u(t) = g(t) + \int_0^t R(t,s)g(s)ds, \quad t \in I.$$

Theorem (Regularity, Brunner, Monograph, 2004)

Assume that  $K \in C^m(D)$ . Then  $R \in C^m(D)$ . Thus, for any  $g \in C^m(I)$  the solution of (V2) satisfies  $u \in C^m(I)$ .

# The regularity of VIEs

## The regularity of (V2)

Recall

$$(V2): \quad u(t) = g(t) + \int_0^t K(t,s)u(s) ds.$$

Theorem (Existence and uniqueness, Brunner, Monograph, 2004)

Let  $K \in C(D)$  and  $R$  denote the resolvent kernel associated with  $K$ . Then for any  $g \in C(I)$ , (V2) has a **unique** solution  $u \in C(I)$ , and this solution is given by

$$u(t) = g(t) + \int_0^t R(t,s)g(s)ds, \quad t \in I.$$

Theorem (Regularity, Brunner, Monograph, 2004)

Assume that  $K \in C^m(D)$ . Then  $R \in C^m(D)$ . Thus, for any  $g \in C^m(I)$  the solution of (V2) satisfies  $u \in C^m(I)$ .

# The regularity of $(V2)_\alpha$

Recall

$$(V2)_\alpha : u(t) = g(t) + \int_0^t (t-s)^{-\alpha} K(t,s)u(s) ds, \quad 0 < \alpha < 1.$$

**Theorem (Existence and Uniqueness, Brunner, Monograph, 2004)**

Assume that  $K \in C(D)$ , and let  $0 < \alpha < 1$ . Then for any  $g \in C(I)$ ,  $(V2)_\alpha$  possesses a *unique solution*  $u \in C(I)$ .

**Theorem (Regularity, Brunner, Monograph, 2004)**

Assume that  $g \in C^m(I)$  and  $K \in C^m(D)$ , with  $K(t,t) \neq 0$  on  $I$ . Then:

(i) For any  $\alpha \in (0, 1)$ , the regularity of the unique solution of  $(V2)_\alpha$  is described by

$$u \in C^m(0, T] \cap C(I), \text{ with } |u'(t)| \leq C_\alpha t^{-\alpha} \text{ for } t \in (0, T].$$

(ii) The solution  $u$  can be written in the form

$$u(t) = \sum_{(j,k)_\alpha} \gamma_{j,k}(\alpha) t^{j+k(1-\alpha)} + Y_m(t; \alpha), \quad t \in I.$$

# The regularity of $(V2)_\alpha$

Recall

$$(V2)_\alpha : u(t) = g(t) + \int_0^t (t-s)^{-\alpha} K(t,s)u(s) ds, \quad 0 < \alpha < 1.$$

Theorem (Existence and Uniqueness, Brunner, Monograph, 2004)

Assume that  $K \in C(D)$ , and let  $0 < \alpha < 1$ . Then for any  $g \in C(I)$ ,  $(V2)_\alpha$  possesses a *unique* solution  $u \in C(I)$ .

Theorem (Regularity, Brunner, Monograph, 2004)

Assume that  $g \in C^m(I)$  and  $K \in C^m(D)$ , with  $K(t,t) \neq 0$  on  $I$ . Then:

(i) For any  $\alpha \in (0, 1)$ , the regularity of the unique solution of  $(V2)_\alpha$  is described by

$$u \in C^m(0, T] \cap C(I), \text{ with } |u'(t)| \leq C_\alpha t^{-\alpha} \text{ for } t \in (0, T].$$

(ii) The solution  $u$  can be written in the form

$$u(t) = \sum_{(j,k)_\alpha} \gamma_{j,k}(\alpha) t^{j+k(1-\alpha)} + Y_m(t; \alpha), \quad t \in I.$$

# Numerical methods

## Review: Discontinuous piecewise polynomial collocation (DC) methods

### ▶ Meshes: Let

$$I_h := \{t_n := nh : n = 0, 1, \dots, N \text{ (} t_N := T)\}$$

be a given **mesh** on  $I = [0, T]$ , with mesh diameter  $h := T/N$ .

### ▶ Discontinuous piecewise polynomials space:

$$S_{m-1}^{(-1)}(I_h) := \{v : v|_{\sigma_n} \in \mathcal{P}_{m-1} \text{ (} 0 \leq n \leq N-1)\},$$

where  $\mathcal{P}_k = \mathcal{P}_k(\sigma_n)$  is the linear space of (real) polynomials of degree not exceeding  $k$  at the interval  $\sigma_n := (t_n, t_{n+1}]$ .

▶ **Collocation points**: For prescribed collocation parameters  $\{c_i\}$ , the set of collocation points is

$$X_h := \{t_n + c_i h_n : 0 < c_1 < \dots < c_m \leq 1 \text{ (} 0 \leq n \leq N-1)\}.$$

The **collocation equation** is

$$u_{DC}(t) = g(t) + \int_0^t K(t, s) u_{DC}(s) ds, \quad t \in X_h,$$

with the **local representation** of the DC solution

$$u_{DC}(t_n + sh) = \sum_{j=1}^m L_j(s) (U_{DC}^n)_j, \quad \text{with } L_j(s) := \prod_{k=1, k \neq j}^m \frac{s - c_k}{c_j - c_k},$$

where  $s \in (0, 1]$  and  $(U_{DC}^n)_j := u_{DC}(t_{n,j})$ .

Denote

$$\mathbf{G}_{DC}^n := (g(t_{n,1}), \dots, g(t_{n,m}))^T, \quad \mathbf{U}_{DC}^n := ((U_{DC}^n)_1, \dots, (U_{DC}^n)_m)^T,$$
$$\mathbf{B}_{DC}^n := \begin{pmatrix} \int_0^{c_i} K(t_{n,i}, t_n + sh) L_j(s) ds \\ (i, j = 1, \dots, m) \end{pmatrix}, \quad \mathbf{B}_{DC}^{(n,l)} := \begin{pmatrix} \int_0^1 K(t_{n,i}, t_l + sh) L_j(s) ds \\ (i, j = 1, \dots, m) \end{pmatrix}.$$

Then the collocation equation can be written as

$$(\mathbf{I}_m - h \mathbf{B}_{DC}^n) \mathbf{U}_{DC}^n = \mathbf{G}_{DC}^n + h \sum_{l=0}^{n-1} \mathbf{B}_{DC}^{(n,l)} \mathbf{U}_{DC}^l.$$

The **collocation equation** is

$$u_{DC}(t) = g(t) + \int_0^t K(t, s) u_{DC}(s) ds, \quad t \in X_h,$$

with the **local representation** of the DC solution

$$u_{DC}(t_n + sh) = \sum_{j=1}^m L_j(s) (U_{DC}^n)_j, \quad \text{with } L_j(s) := \prod_{k=1, k \neq j}^m \frac{s - c_k}{c_j - c_k},$$

where  $s \in (0, 1]$  and  $(U_{DC}^n)_j := u_{DC}(t_{n,j})$ .

Denote

$$\mathbf{G}_{DC}^n := (g(t_{n,1}), \dots, g(t_{n,m}))^T, \quad \mathbf{U}_{DC}^n := ((U_{DC}^n)_1, \dots, (U_{DC}^n)_m)^T,$$
$$\mathbf{B}_{DC}^n := \left( \begin{array}{c} \int_0^{c_i} K(t_{n,i}, t_n + sh) L_j(s) ds \\ (i, j = 1, \dots, m) \end{array} \right), \quad \mathbf{B}_{DC}^{(n,l)} := \left( \begin{array}{c} \int_0^1 K(t_{n,i}, t_l + sh) L_j(s) ds \\ (i, j = 1, \dots, m) \end{array} \right).$$

Then the collocation equation can be written as

$$(\mathbf{I}_m - h\mathbf{B}_{DC}^n) \mathbf{U}_{DC}^n = \mathbf{G}_{DC}^n + h \sum_{l=0}^{n-1} \mathbf{B}_{DC}^{(n,l)} \mathbf{U}_{DC}^l.$$

# Fully discretised discontinuous collocation (FDC) methods

In general, the integrals of  $B_{DC}^n, B_{DC}^{(n,l)}$  cannot be found analytically, but have to be approximated by suitable numerical quadrature formulas.

On  $\sigma_n$ , we choose interpolatory  $m$ -point quadrature formulas whose abscissas are based on the  $m$  collocation parameters  $\{c_i\}$ , and denote  $b_j := \int_0^1 L_j(s) ds$  as the corresponding weights. Then

$$\int_0^{c_i} K(t_{n,i}, t_n + sh) L_j(s) ds \approx c_i \sum_{k=1}^m K(t_{n,i}, t_n + c_i c_k h) L_j(c_i c_k) b_k,$$

$$\int_0^1 K(t_{n,i}, t_l + sh) L_j(s) ds \approx \sum_{k=1}^m K(t_{n,i}, t_n + c_k h) L_j(c_k) b_k = K(t_{n,i}, t_{l,j}) b_j.$$

Therefore,

$$\left(\mathbf{I}_m - h \hat{\mathbf{B}}_{DC}^n\right) \hat{\mathbf{U}}_{DC}^n = \mathbf{G}_{DC}^n + h \sum_{l=0}^{n-1} \hat{\mathbf{B}}_{DC}^{(n,l)} \hat{\mathbf{U}}_{DC}^l.$$

## DG methods

We are looking for the DG solution  $u_{DG} \in \mathcal{S}_{m-1}^{(-1)}(I_h)$ , such that for  $\forall \phi \in \mathcal{S}_{m-1}^{(-1)}(I_h)$ ,

$$\int_{t_n}^{t_{n+1}} u_{DG}(s) \phi(s) ds = \int_{t_n}^{t_{n+1}} g(s) \phi(s) ds + \int_{t_n}^{t_{n+1}} \left( \int_0^s K(s, v) u_{DG}(v) dv \right) \phi(s) ds.$$

The local representation of the DG solution on the subinterval  $\sigma_n$ :

$$u_{DG}(t_n + sh) = \sum_{j=0}^{m-1} P_j(s) (U_{DG}^n)_j, \quad s \in (0, 1],$$

where  $P_j(s)$  ( $j = 0, \dots, m-1$ ) denote the 'shifted' Legendre polynomials of degree  $j$  on  $[0, 1]$ , and  $(U_{DG}^n)_j$  are unknown coefficients to be determined. Denote

$$\mathbf{G}_{DG}^n := \left( \int_0^1 g(t_n + sh) P_i(s) ds \quad (i = 0, \dots, m-1) \right)^T,$$

$$\mathbf{U}_{DG}^n := \left( (U_{DG}^n)_0, \dots, (U_{DG}^n)_{m-1} \right)^T, \quad \mathbf{A}_{DG} := \begin{pmatrix} \int_0^1 P_j(s) P_i(s) ds \\ (i, j = 0, \dots, m-1) \end{pmatrix},$$

## DG methods

We are looking for the DG solution  $u_{DG} \in \mathcal{S}_{m-1}^{(-1)}(I_h)$ , such that for  $\forall \phi \in \mathcal{S}_{m-1}^{(-1)}(I_h)$ ,

$$\int_{t_n}^{t_{n+1}} u_{DG}(s) \phi(s) ds = \int_{t_n}^{t_{n+1}} g(s) \phi(s) ds + \int_{t_n}^{t_{n+1}} \left( \int_0^s K(s, v) u_{DG}(v) dv \right) \phi(s) ds.$$

The **local representation** of the DG solution on the subinterval  $\sigma_n$ :

$$u_{DG}(t_n + sh) = \sum_{j=0}^{m-1} P_j(s) (U_{DG}^n)_j, \quad s \in (0, 1],$$

where  $P_j(s)$  ( $j = 0, \dots, m-1$ ) denote the **'shifted' Legendre polynomials** of degree  $j$  on  $[0, 1]$ , and  $(U_{DG}^n)_j$  are unknown coefficients to be determined. Denote

$$\mathbf{G}_{DG}^n := \left( \int_0^1 g(t_n + sh_n) P_i(s) ds \quad (i = 0, \dots, m-1) \right)^T,$$
$$\mathbf{U}_{DG}^n := \left( (U_{DG}^n)_0, \dots, (U_{DG}^n)_{m-1} \right)^T, \quad \mathbf{A}_{DG} := \begin{pmatrix} \int_0^1 P_j(s) P_i(s) ds \\ (i, j = 0, \dots, m-1) \end{pmatrix},$$

## DG methods

We are looking for the DG solution  $u_{DG} \in \mathcal{S}_{m-1}^{(-1)}(I_h)$ , such that for  $\forall \phi \in \mathcal{S}_{m-1}^{(-1)}(I_h)$ ,

$$\int_{t_n}^{t_{n+1}} u_{DG}(s) \phi(s) ds = \int_{t_n}^{t_{n+1}} g(s) \phi(s) ds + \int_{t_n}^{t_{n+1}} \left( \int_0^s K(s, v) u_{DG}(v) dv \right) \phi(s) ds.$$

The **local representation** of the DG solution on the subinterval  $\sigma_n$ :

$$u_{DG}(t_n + sh) = \sum_{j=0}^{m-1} P_j(s) (U_{DG}^n)_j, \quad s \in (0, 1],$$

where  $P_j(s)$  ( $j = 0, \dots, m-1$ ) denote the **'shifted' Legendre polynomials** of degree  $j$  on  $[0, 1]$ , and  $(U_{DG}^n)_j$  are unknown coefficients to be determined. Denote

$$\mathbf{G}_{DG}^n := \left( \int_0^1 g(t_n + sh_n) P_i(s) ds \quad (i = 0, \dots, m-1) \right)^T,$$

$$\mathbf{U}_{DG}^n := \left( (U_{DG}^n)_0, \dots, (U_{DG}^n)_{m-1} \right)^T, \quad \mathbf{A}_{DG} := \begin{pmatrix} \int_0^1 P_j(s) P_i(s) ds \\ (i, j = 0, \dots, m-1) \end{pmatrix},$$

$$\mathbf{B}_{DG}^n := \begin{pmatrix} \int_0^1 \left( \int_0^s K(t_n + sh, t_l + vh) P_j(v) dv \right) P_i(s) ds \\ (i, j = 0, \dots, m-1) \end{pmatrix},$$

$$\mathbf{B}_{DG}^{(n,l)} := \begin{pmatrix} \int_0^1 \left( \int_0^1 K(t_n + sh, t_l + vh) P_j(v) dv \right) P_i(s) ds \\ (i, j = 0, \dots, m-1) \end{pmatrix}.$$

Then

$$(\mathbf{A}_{DG} - h\mathbf{B}_{DG}^n) \mathbf{U}_{DG}^n = \mathbf{G}_{DG}^n + h \sum_{l=0}^{n-1} \mathbf{B}_{DG}^{(n,l)} \mathbf{U}_{DG}^l.$$

Note that

$$\mathbf{A}_{DG} := \begin{pmatrix} \int_0^1 P_i(s) P_j(s) ds \\ (i, j = 0, \dots, m-1) \end{pmatrix} = \begin{pmatrix} 1 & & & \\ & \frac{1}{3} & & \\ & & \ddots & \\ & & & \frac{1}{2m-1} \end{pmatrix}$$

is **nonsingular**. For sufficiently small  $h$ , there determines a **unique DG solution**.

### Remark

If a **different set of basis functions** is employed, the resulting DG solutions are **equivalent**.

# QDG schemes and the relationship with DC schemes

QDG schemes is obtained from DG schemes: approximating the inner product by suitable numerical quadrature formulas.

On  $\sigma_n$ , suppose that the quadrature nodes and weights are based on  $\{d_i\}_{i=1}^q$  and  $\{w_i\}_{i=1}^q$ , respectively, where  $q \geq m$ ,  $0 \leq d_1 < \dots < d_q \leq 1$ , and at least  $m$  weights are nonzero. Employing the basis functions  $L_j(s)$ , we have

$$\begin{aligned} \sum_{j=1}^m \sum_{k=1}^q L_j(d_k) L_i(d_k) w_k (\bar{U}_{DG}^n)_j &= \sum_{k=1}^q g(t_n + d_k h) L_i(d_k) w_k \\ &+ \sum_{k=1}^q \left[ h \sum_{j=1}^m \int_0^{d_k} K(t_n + d_k h, t_n + v h) L_j(v) dv (\bar{U}_{DG}^n)_j \right. \\ &\quad \left. + \sum_{l=0}^{n-1} h \sum_{j=1}^m \int_0^1 K(t_n + d_k h, t_l + v h) L_j(v) dv (\bar{U}_{DG}^l)_j \right] L_i(d_k) w_k. \end{aligned}$$

Now consider the **special case** with  $q = m$  and  $d_k = c_k$ . Then

$$\begin{aligned} \sum_{j=1}^m \sum_{k=1}^m L_j(c_k) L_i(c_k) w_k (\bar{U}_{DG}^n)_j &= \sum_{k=1}^m g(t_n + c_k h) L_i(c_k) w_k \\ &+ \sum_{k=1}^m \left[ h \sum_{j=1}^m \int_0^{c_k} K(t_n + c_k h, t_n + v h) L_j(v) dv (\bar{U}_{DG}^n)_j \right. \\ &\quad \left. + \sum_{l=0}^{n-1} h \sum_{j=1}^m \int_0^1 K(t_n + c_k h, t_l + v h) L_j(v) dv (\bar{U}_{DG}^l)_j \right] L_i(c_k) w_k. \end{aligned}$$

For  $w_i \neq 0$ , we obtain

$$\begin{aligned} (\bar{U}_{DG}^n)_i &= g(t_{n,i}) + h \sum_{j=1}^m \int_0^{c_j} K(t_{n,i}, t_n + v h) L_j(v) dv (\bar{U}_{DG}^n)_j \\ &+ \sum_{l=0}^{n-1} h \sum_{j=1}^m \int_0^1 K(t_{n,i}, t_l + v h) L_j(v) dv (\bar{U}_{DG}^l)_j, \end{aligned}$$

which is exactly the DC scheme.

## Theorem (Liang, NMTMA, 2022)

Suppose that the **inner products** are approximated by  $m$ -point quadrature with **nonzero weights**  $w_1, \dots, w_m$  and **nodes**  $0 < d_1 < \dots < d_m \leq 1$ . Then the resulting **QDG** scheme is **identical** to the **DC** scheme with the collocation parameters  $\{c_i\}_{i=1}^m = \{d_i\}_{i=1}^m$  **whatever the choice of weights**.

# FDG schemes and the relationship with FDC schemes

FDG schemes is obtained from QDG schemes: approximating the **integral** by suitable **numerical quadrature formulas**.

Similar to FDC, we obtain

$$\begin{aligned} \left(\hat{U}_{DG}^n\right)_i &= g(t_{n,i}) + hc_i \sum_{j=1}^m \sum_{k=1}^m K(t_{n,i}, t_n + c_i c_k h) L_j(c_i c_k) b_k \left(\hat{U}_{DG}^n\right)_j \\ &\quad + \sum_{l=0}^{n-1} h \sum_{j=1}^m K(t_{n,i}, t_{l,j}) b_j \left(\hat{U}_{DG}^l\right)_i, \end{aligned}$$

which is exactly the FDC scheme.

**Theorem** [Liang, NMTMA, 2022]

The resulting FDG scheme is **identical** to the FDC scheme.

# Error analysis

Recall the error analysis of DC methods

## Theorem (DC methods, Brunner, Monograph, 2004)

Assume that  $g \in C^m(I)$ ,  $K \in C^m(D)$ , and  $u_h \in S_{m-1}^{(-1)}(I_h)$  is the collocation solution for (V2). Then

$$\|u - u_{DC}\|_\infty := \sup_{t \in I} |u(t) - u_{DC}(t)| \leq C \|u^{(m)}\|_\infty h^m.$$

holds for any set  $X_h$  of collocation points with  $0 \leq c_1 < \dots < c_m \leq 1$ .

## Theorem (FDC methods, Brunner, Monograph, 2004)

The FDC solution  $\hat{u}_{DC}$  has the *same* convergence property as  $u_{DC}$ .

# Error analysis for DG methods

Theorem (Zhang, Lin & Rao, 2000; Liang, NMTMA, 2022)

Assume:

- (a)  $g \in C^m(I)$  and  $K \in C^m(D)$ .
- (b)  $u$  and  $u_{DG} \in S_{m-1}^{(-1)}(I_h)$  are the exact solution and the DG solution.

Then for sufficiently small  $h$ ,

$$\|u - u_{DG}\|_{\infty} := \sup_{t \in I} |u(t) - u_{DG}(t)| \leq C_{DG} \|u^{(m)}\|_{\infty} h^m.$$

# DG methods for $(V2)_\alpha$

Recall

$$(V2)_\alpha : u(t) = g(t) + \int_0^t (t-s)^{-\alpha} K(t,s)u(s) ds, \quad 0 < \alpha < 1,$$

with regularity

$$u \in C^m(0, T] \cap C(I), \text{ with } |u'(t)| \leq C_\alpha t^{-\alpha} \text{ for } t \in (0, T].$$

$\hookrightarrow$  Graded mesh:  $I_h := \{t_n := (\frac{n}{N})^r T : n = 0, 1, \dots, N\}$  with  $N \geq 2$  and  $r \geq 1$ .

We are looking for the DG solution  $u_h \in S_{m-1}^{(-1)}(I_h)$ , such that for  $\forall \phi \in S_{m-1}^{(-1)}(I_h)$ ,

$$\int_{t_n}^{t_{n+1}} u_h(s)\phi(s) ds = \int_{t_n}^{t_{n+1}} g(s)\phi(s) ds + \int_{t_n}^{t_{n+1}} \left( \int_0^s (s-v)^{-\alpha} K(s,v)u_h(v) dv \right) \phi(s) ds.$$

The local representation of the DG solution:

$$u_h(t_n + sh_n) = \sum_{j=0}^{m-1} P_j(s)U_{n,j}, \quad s \in (0, 1],$$

where  $(U_{DG}^n)_j$  are unknown coefficients to be determined.

# DG methods for $(V2)_\alpha$

Recall

$$(V2)_\alpha : u(t) = g(t) + \int_0^t (t-s)^{-\alpha} K(t,s)u(s) ds, \quad 0 < \alpha < 1,$$

with regularity

$$u \in C^m(0, T] \cap C(I), \text{ with } |u'(t)| \leq C_\alpha t^{-\alpha} \text{ for } t \in (0, T].$$

↪ Graded mesh:  $I_h := \{t_n := (\frac{n}{N})^r T : n = 0, 1, \dots, N\}$  with  $N \geq 2$  and  $r \geq 1$ .

We are looking for the DG solution  $u_h \in S_{m-1}^{(-1)}(I_h)$ , such that for  $\forall \phi \in S_{m-1}^{(-1)}(I_h)$ ,

$$\int_{t_n}^{t_{n+1}} u_h(s)\phi(s) ds = \int_{t_n}^{t_{n+1}} g(s)\phi(s) ds + \int_{t_n}^{t_{n+1}} \left( \int_0^s (s-v)^{-\alpha} K(s,v)u_h(v) dv \right) \phi(s) ds.$$

The local representation of the DG solution:

$$u_h(t_n + sh_n) = \sum_{j=0}^{m-1} P_j(s)U_{n,j}, \quad s \in (0, 1],$$

where  $(U_{DG}^n)_j$  are unknown coefficients to be determined.

Denote

$$\mathbf{G}_n := \left( \int_0^1 g(t_n + sh_n) P_0(s) ds, \dots, \int_0^1 g(t_n + sh_n) P_{m-1}(s) ds \right)^T,$$

$$\mathbf{U}_n := (U_{n,0}, \dots, U_{n,m-1})^T, \mathbf{A} := \begin{pmatrix} \int_0^1 P_j(s) P_i(s) ds \\ (i, j = 0, \dots, m-1) \end{pmatrix},$$

$$\mathbf{B}_n(\alpha) := \begin{pmatrix} \int_0^1 \left( \int_0^s (s-v)^{-\alpha} K(t_n + sh_n, t_n + vh_n) P_j(v) dv \right) P_i(s) ds \\ (i, j = 0, \dots, m-1) \end{pmatrix},$$

$$\mathbf{B}^{(n,l)}(\alpha) := \begin{pmatrix} \int_0^1 \left( \int_0^1 \left( \frac{t_n + sh_n - t_l}{h_l} - v \right)^{-\alpha} K(t_n + sh_n, t_l + vh_l) P_j(v) dv \right) P_i(s) ds \\ (i, j = 0, \dots, m-1) \end{pmatrix}.$$

Therefore,

$$(\mathbf{A} - h_n^{1-\alpha} \mathbf{B}_n(\alpha)) \mathbf{U}_n = \mathbf{G}_n + \sum_{l=0}^{n-1} h_l^{1-\alpha} \mathbf{B}^{(n,l)}(\alpha) \mathbf{U}_l.$$

For sufficiently small  $h$ , there determines a unique DG solution.

## QDG methods for $(V2)_\alpha$

### Theorem (Liang, ANM, 2022)

Suppose that the *inner products* are approximated by  $m$ -point quadrature with *nonzero weights*  $w_1, \dots, w_m$  and *nodes*  $0 < d_1 < \dots < d_m \leq 1$ . Then the resulting **QDG** scheme is *identical* to the **DC** scheme with the collocation parameters  $\{c_i\}_{i=1}^m = \{d_i\}_{i=1}^m$  *whatever the choice of weights*.

## Error estimate for $(V2)_\alpha$

### Theorem (Liang, ANM, 2022)

Assume:

- (a)  $g \in C^m(I)$  and  $K \in C^m(D)$  with  $K(t, t) \neq 0$ .
- (b)  $u$  and  $u_{DG} \in S_{m-1}^{(-1)}(I_h)$  are the exact solution and the DG solution.

Then for sufficiently small  $h$ ,

$$\|u - u_h\|_\infty := \sup_{t \in I} |u(t) - u_h(t)| \leq Ch^{\min\{r(1-\alpha), m\}}.$$

### Remark

The convergence order for the **DG method** in  $S_{m-1}^{(-1)}(I_h)$  is **as same as** the one for the **DC method** in the same polynomial space.

# Continuous methods for (V2)

## CC methods

We seek the CC solution  $u_{CC}$  in the piecewise polynomial space

$$S_m^{(0)}(I_h) := \{v \in C(I) : v|_{\bar{\sigma}_n} \in \mathcal{P}_m \ (0 \leq n \leq N-1)\}$$

of *continuous* piecewise polynomials of degree  $m \geq 0$ .

At  $t = t_{n,i}$ , the *collocation equation* reads as

$$u_{CC}(t) = g(t) + \int_0^t K(t,s)u_{CC}(s) ds, \quad t \in X_h,$$

with  $u_{CC}(0) = g(0)$ . The *local representation* of the CC solution

$$u_{CC}(t_n + sh) = \sum_{j=0}^m l_j(s) (U_{CC}^n)_j, \quad s \in [0, 1],$$

where  $(U_{CC}^n)_0 := u_{CC}(t_n)$ ,  $(U_{CC}^n)_j := u_{CC}(t_{n,j})$  for  $j = 1, \dots, m$ , and

$$l_0(s) := \prod_{i=1}^m \frac{s - c_i}{-c_i}, \quad l_j(s) := \frac{s}{c_j} \prod_{i=1, i \neq j}^m \frac{s - c_i}{c_j - c_i}.$$

# Error analysis for CC methods

## Theorem (CC methods, Liang & Brunner, BIT, 2016)

The *CC solution*  $u_{CC} \in S_m^{(0)}(I_h)$  *converges* to the exact solution  $u$  *if, and only if*, the collocation parameters  $\{c_i\}$  satisfy the condition

$$-1 \leq \rho_m := (-1)^m \prod_{i=1}^m \frac{1 - c_i}{c_i} \leq 1.$$

The corresponding attainable global order of convergence is given by

$$\max_{t \in I} |u(t) - u_h(t)| \leq C \begin{cases} h^{m+1}, & \text{if } -1 \leq \rho_m < 1, \\ h^m, & \text{if } \rho_m = 1. \end{cases}$$

*Remark:* The condition  $-1 \leq \rho_m \leq 1$  is also the same sufficient and necessary condition to ensure the convergence of DC methods for (V1).

# Error analysis for CC methods

## Theorem (CC methods, Liang & Brunner, BIT, 2016)

The *CC solution*  $u_{CC} \in S_m^{(0)}(I_h)$  *converges* to the exact solution  $u$  *if, and only if*, the collocation parameters  $\{c_i\}$  satisfy the condition

$$-1 \leq \rho_m := (-1)^m \prod_{i=1}^m \frac{1 - c_i}{c_i} \leq 1.$$

The corresponding attainable global order of convergence is given by

$$\max_{t \in I} |u(t) - u_h(t)| \leq C \begin{cases} h^{m+1}, & \text{if } -1 \leq \rho_m < 1, \\ h^m, & \text{if } \rho_m = 1. \end{cases}$$

**Remark:** The condition  $-1 \leq \rho_m \leq 1$  is also the same sufficient and necessary condition to ensure the convergence of DC methods for (V1).

# Error analysis for FCC methods

Theorem (FCC methods, Liang, NMTMA, 2022)

The *FCC solution*  $\hat{u}_{CC}$  has the *same* convergence property as the *CC solution*  $u_{CC}$ .

# Outline

- 1 Volterra integral equations (VIEs)
  - What is VIEs?
  - Fractional differential equations (FDEs) and VIEs

- 2 Discontinuous methods
  - DG methods for (V2)
  - DG methods for  $(V2)_\alpha$
- 3 Continuous methods
  - CC methods for (V2)
  - **CG methods for (V2)**
  - CC methods for  $(V2)_\alpha$
- 4 Numerical examples

## CG methods for (V2)

We are looking for the **CG solution**  $u_{CG} \in S_m^{(0)}(I_h)$  such that for  $0 \leq n \leq N - 1$  and any  $\eta \in \mathcal{P}_{m-1}$ ,

$$\int_{t_n}^{t_{n+1}} u_{CG}(s)\eta(s) ds = \int_{t_n}^{t_{n+1}} g(s)\eta(s) ds + \int_{t_n}^{t_{n+1}} \int_0^s K(s, v)u_{CG}(v) dv\eta(s) ds.$$

Here, because of the continuity of  $u_{CG}(t)$ , we have  $u_{CG}(t_{n-1}) = \lim_{t \rightarrow t_{n-1}^-} u_{CG}(t) = \lim_{t \rightarrow t_{n-1}^+} u_{CG}(t)$ . Hence  $u_{CG}(t)$  has only  $m$  degrees of freedom on each subinterval, so  $\eta \in \mathcal{P}_{m-1}$  (see [Huang, Xu & Brunner \(2016\)](#)).

The **local representation** of the CG solution

$$u_{CG}(t_n + sh) = \sum_{j=0}^m P_j(s) (U_{CG}^n)_j, \quad s \in [0, 1],$$

where the unknown coefficients  $(U_{CG}^n)_j$  are to be determined.

## CG methods for (V2)

We are looking for the **CG solution**  $u_{CG} \in S_m^{(0)}(I_h)$  such that for  $0 \leq n \leq N - 1$  and any  $\eta \in \mathcal{P}_{m-1}$ ,

$$\int_{t_n}^{t_{n+1}} u_{CG}(s)\eta(s) ds = \int_{t_n}^{t_{n+1}} g(s)\eta(s) ds + \int_{t_n}^{t_{n+1}} \int_0^s K(s, v)u_{CG}(v) dv\eta(s) ds.$$

Here, because of the continuity of  $u_{CG}(t)$ , we have  $u_{CG}(t_{n-1}) = \lim_{t \rightarrow t_{n-1}^-} u_{CG}(t) = \lim_{t \rightarrow t_{n-1}^+} u_{CG}(t)$ . Hence  $u_{CG}(t)$  has only  $m$  degrees of freedom on each subinterval, so  $\eta \in \mathcal{P}_{m-1}$  (see [Huang, Xu & Brunner \(2016\)](#)).

The **local representation** of the CG solution

$$u_{CG}(t_n + sh) = \sum_{j=0}^m P_j(s) (U_{CG}^n)_j, \quad s \in [0, 1],$$

where the unknown coefficients  $(U_{CG}^n)_j$  are to be determined.

Denote

$$\mathbf{U}_{CG}^n := ((U_{CG}^n)_0, \dots, (U_{CG}^n)_m)^T, \quad \mathbf{A}_{CG}^n := \begin{pmatrix} \int_0^1 P_j(s)P_i(s) ds \\ (i = 0, \dots, m-1; j = 0, \dots, m) \end{pmatrix},$$

$$\mathbf{B}_{CG}^n := \begin{pmatrix} \int_0^1 \left( \int_0^s K(t_n + sh, t_n + vh) P_j(v) dv \right) P_i(s) ds \\ (i = 0, \dots, m-1; j = 0, \dots, m) \end{pmatrix},$$

$$\mathbf{B}_{CG}^{(n,l)} := \begin{pmatrix} \int_0^1 \left( \int_0^1 K(t_n + sh, t_l + vh) P_j(v) dv \right) P_i(s) ds \\ (i = 0, \dots, m-1; j = 0, \dots, m) \end{pmatrix}.$$

Then by the continuity,

$$\begin{aligned} & \begin{pmatrix} (P_0(0), \dots, P_m(0)) \\ (\mathbf{A}_{CG}^n - h\mathbf{B}_{CG}^n) \end{pmatrix} \mathbf{U}_{CG}^n \\ &= \begin{pmatrix} (P_0(1), \dots, P_m(1)) \\ \mathbf{0}_{m \times (m+1)} \end{pmatrix} \mathbf{U}_{CG}^{n-1} + h \sum_{l=0}^{n-1} \begin{pmatrix} \mathbf{0}_{1 \times (m+1)} \\ \mathbf{B}_{CG}^{(n,l)} \end{pmatrix} \mathbf{U}_{CG}^l + \begin{pmatrix} 0 \\ \mathbf{G}_{DG}^n \end{pmatrix}. \end{aligned}$$

Note: Whatever the choice of basis functions, the resulting CG solutions are equivalent.

# QCG schemes and the relationship with CC schemes

## Theorem (Liang, NMTMA, 2022)

Suppose that the inner products are approximated by  $m + 1$ -point quadrature with *nonzero weights*  $w_0, \dots, w_m$  and *nodes*  $0 < d_0 < \dots < d_m \leq 1$ . Then the resulting **QCG** scheme is *identical* to the **CC** scheme with the collocation parameters  $\{c_i\}_{i=0}^m = \{d_i\}_{i=0}^m$  *whatever the choice of weights*.

# FCG schemes and the relationship with FCC schemes

Theorem (Liang, NMTMA, 2022)

*The resulting FCG scheme is identical to the FCC scheme.*

# Error analysis for CG methods

## Theorem (CG methods, Liang, NMTMA, 2022)

Assume:

(a)  $g \in C^{m+2}(I)$  and  $K \in C^{m+2}(D)$ .

(b)  $u$  and  $u_{CG} \in S_m^{(0)}(I_h)$  are the exact solution and the CG solution.

Then for sufficiently small  $h$ ,

$$\|u - u_{CG}\|_{\infty} := \max_{t \in I} |u(t) - u_{CG}(t)| \leq C_{CG} \begin{cases} h^{m+1}, & \text{if } m \text{ is odd;} \\ h^m, & \text{if } m \text{ is even.} \end{cases}$$

**Remark:** The convergence of the CG method for (V2) depends on the parity of  $m$ , which is similar to the convergence of the DG method for (V1).

# Error analysis for CG methods

## Theorem (CG methods, Liang, NMTMA, 2022)

## Example

We take  $K(t, s) = e^{t-s}$ ,  $g(t) = \frac{3e^{-t} - e^t}{2}$ . It is easy to check that it has the same exact solution as the above example.

# Conclusions and future work

## Conclusions:

- Discontinuous methods
  - Convergence analysis of DG methods for  $(V2)$
  - Convergence analysis of DG methods for  $(V2)_\alpha$
- Discontinuous methods
  - Convergence analysis of CC methods for  $(V2)$
  - Convergence analysis of CG methods for  $(V2)$
  - Convergence analysis of CC methods for  $(V2)_\alpha$

**Future work:** Convergence analysis of CG methods for  $(V2)_\alpha$

第五届分数阶微分方程的数值分析及其应用国际研讨会  
(The 5th International Workshop on Numerical Analysis and Applications for  
Fractional Differential Equations)

2023年11月10-13日 哈尔滨工业大学（深圳）  
(November 10-13, 2023 Harbin Institute of Technology, Shenzhen)

*Welcome! Thanks!*
